Assumptions

1. department, patient, doctor are entity sets
2. department-code is primary key for department set
3. doctor is identified by doctor-id
4. patient is identified by patient-id
5. department name has only one word
6. Each department can have only one HOD
7. HOD name can have first, middle and last words
8. Patient name can have first, middle and last words
9. age is a derived attribute and can be found using date of birth and current date for the patient
10. phone number for the patient is a multivariate attribute as a patient can have one or more phone numbers
11. doctor name comprises of first, middle and last words.
12. doctor name, patient name and HOD name are comprised attributes
13. department-code is also an attribute for doctor entity set because we need to maintain the department of doctor (carper question)
14. A department can have 0 or more patients
15. A patient can be admitted to one or many departments identified by date of admission and release.
16. A department can have 0 or more doctors

17. A doctor must belong to ~~any~~ ^{only} one department.
18. A patient must be admitted to a department.
19. A patient must be assigned to atleast one doctor.
20. A doctor can have 0 or more patients.
21. Date of admission and release are related with patient and department and has no relation with doctor. Implying, a doctor can be assigned to a patient and viceversa without maintaining date of admission or release.
22. We maintain start-treatment and end-treatment dates for the patient ~~and~~ with respect to any doctor.
23. Street is a composite attribute containing street-number, street name ~~and~~ ~~postage code~~.
24. ~~A patient who is assigned a doctor~~
When a patient is admitted to a department, he may have different doctors for same time. Hence we maintain start-treatment and end-treatment attribute for doctor-patient relation.
25. address is a composite variable containing house no., street name, street no., city, state and pin code.
